CAD Light

Option light makes it possible to position a variety of spotlights (round, square, or rectangular) into stringers.

Furthermore, it is possible to add light strips on treads (in front of the riser), under treads (on the tread protrusion), and below child protection bars. The respective parameters are entered via the presets (drilling patterns) and are then available during construction.

Settings for cable grooves, cables going through, and transformer drillings can be edited during construction in the properties.
